

HANDS RENTAL

ACHIEVE FULL CONTROL AND OPTIMAL UTILISATION OF THE RENTAL PARK

Hands ASA has developed a specially designed business system, Hands Rental, for firms that are partly involved in renting out or hiring equipment and personnel. The system is fully integrated as a supplementary module in Microsoft Dynamics AX.

With Hands Rental you always know exactly where objects you are renting out are and their return date. If a requested object is not in stock, you can do the paperwork required to hire or purchase it from a third party directly from the rental order. When the customer returns the object, you can decide whether it should be taken in for servicing before it is ready for a new rental. You then list the hours and articles required for the service, thus giving you full control over expenses and income associated with the object throughout its lifetime.

SCANNING BAR CODES

Scanners are used to pick out, supply and receive objects. The system traces and updates the correct rental orders by recognising their bar code.

DOCUMENT HANDLING

Certificates, drawings and other documents are automatically registered on the rental line and will be printed out when the objects are delivered.

INTEGRATION WITH OTHER MODULES

The system is fully integrated with other modules, such as stores, purchasing, servicing and financing. This provides a full overview and traceability of the transactions fed into the system and avoids data being registered twice.

HISTORY

The data recorded give you a complete survey of all the rental orders associated with the object, including rental period and rates.
